Description

The software enhances the standard paper-based data collection necessary in HACCP by using a handheld computer to gather data electronically.

The program assists in scheduling, tracking and documenting the inspections of critical control points (CCPs), streamlining processes and ensuring compliance.

The system is claimed to reduce the time it takes to complete an inspection and can document abnormalities found during inspection. Reports provide accurate, up-to-date information and allow for easy trending to identify problem areas.

It can be used with doHACCP software to help create and manage HACCP plans.
